

Why your team should participate in the open source projects it depends on
Rich Bowen, Open Source Strategist

Speaker Notes

If you have been to a talk about open source in the last 10 years, you've probably seen this image.

It's about how completely the entire planet depends on open source, in ways that we're not even aware of.

Speaker Notes

Understanding each component of a running system ensures that there are no surprises.

Every AWS service depends, to some extent, on open source software.

But our participation in open source varies greatly from one team to another.

Let's talk about why your team should contribute to open source.

Speaker Notes

Sustainability

- Ensure that a project is still viable once our customers have built their business on top of it.
- You can only be sure of that if we are paying attention
- Pay attention to participation metrics around a project so that you are aware of upcoming risks

Speaker Notes

Ensuring Sustainability

- Chop wood, carry water
- Ensure that bugs are addressed and PRs reviewed. This also helps you understand what our customers struggle with.
- Fastest way to earn trust in a project

Speaker Notes

Listen, and participate in the discussions

- Participating in user discussions (Slack, issue tracker, mailing lists) opens your eyes to problems that our customers are having
- Advocating for customer priorities ensures that the next version addresses them.
- Participating in decision-making is the only way that our customer priorities will be heard. Failure to do so ensures that decisions are made by our competitors.

Speaker Notes

Technical debt

- Carrying a patch set is very expensive.
- Makes deploying new versions much more time consuming
- Risks the project going a different direction, making your innovations useless.

Speaker Notes

Security

- Being involved in project community gives greater visibility into security concerns, and the ability to address them more quickly
- You don't want to find out about a security breach on the news; you want to prevent it ever happening.

Collaboration

No matter who you are, most of the smartest people work for someone else.

-- Bill Joy

Speaker Notes

Working with our peers gives you the insights into problem solving that would not have occurred to you working alone.

Diversity of opinion, and diversity of innovation, comes from working with people outside of your little bubble.

Speaker Notes

Expertise

Working directly in the project is by far the best way to gain expertise in the software.

Software start-ups have a phrase for what Amazon is doing to them: ‘strip-mining’ them of their innovations.

By Daisuke Wakabayashi

Speaker Notes

Can lead to ...

Resistance to AWS priorities

Change in licenses

Lots of negative press

The need to fork

Speaker Notes

- Forking is very, very expensive
- LF says it's 4.5 x as expensive as working with the existing project
- Rather than participating in a shared infrastructure, you have to do it ALL yourself.

- Ensure the long-term sustainability of projects that we (and our customers) rely on
- Ensure that our customers' voices are heard in decisions
- Ensure security, and high quality of technical product
- Collaborate with our peers to innovate faster
- Develop deeper expertise in the project by participating directly rather than just consuming
- Consuming, without participating, builds resentment and hostility
- Technical debt is expensive. Forking is even more expensive.
